## **Annual Report of Activities Conducted under the Cooperative Aquatic Plant Control Program in Florida Public Waters for Fiscal Year 2014-2015**

This report was prepared in accordance with §369.22 (7), Florida Statutes, to provide an annual summary of plants treated and funding necessary to manage aquatic plants in public waters. The Cooperative Aquatic Plant Control Program administered by the Florida Fish and Wildlife Conservation Commission (FWC) in Florida's public waters involves complex operational and financial interactions between state, federal and local governments as well as private sector companies.

The FWC receives some federal funding through the U.S. Army Corps of Engineers (USACE) and the USACE directly funds and controls aquatic plants, employing USACE management crews in much of the St. Johns River and its tributaries. Since all of the public waters managed by the USACE are eligible for state funding through the Cooperative Program, and since the FWC occasionally assists in control operations in these waters, FWC staff monitors plant populations and control efforts and includes USACE activities in this report. Management operations and expenditures are reported for the state fiscal year that extends from July 1, 2014 – June 30, 2015, although local and federal governments and water management districts operate on a fiscal year that runs from October 1 – September 30.

Waters eligible for funding under the Cooperative Program include those on sovereignty lands accessible via public boat ramp, as well as waters that are designated Fish Management Areas and waters that lie within FWC Wildlife Management Areas. While control activities and expenditures are reported for the state fiscal year, plant presence and abundance is reported on a seasonal basis to better compare plant growth and management response through an annual growth cycle. Invasive aquatic plants are inventoried each year in Florida's 463 public lakes and rivers that cover approximately 1.27 million acres. Inventories are conducted during the peak growing period, from April through November. These inventories provide a mechanism for early detection and rapid response to control new invasive plant introductions before they become established and require long-term and large-scale management. For invasive plant populations that are already established, inventories provide information to develop management priorities and document funding needs on a statewide basis. Finally, annual aquatic plant inventories document changes in plant communities in response to management efforts as well as changes that may occur in waters where no control has been implemented.

FWC's aquatic plant management program mission is to reduce negative impacts from invasive nonindigenous plants like water hyacinth, water lettuce and hydrilla to conserve the multiple uses and functions of public lakes and rivers. FWC biologists work with stakeholders to identify the primary uses and functions of each public waterbody. Aquatic plant populations are inventoried at least once each year in these systems with emphasis on invasive species to determine if plants impair or may impair the identified uses and functions. Management objectives are then developed for each waterbody and funding is allocated to address statewide management priorities for the ensuing fiscal year. Invasive plants infest 97% of Florida's 457 public waters inventoried in 2015. Once established, eradicating invasive plants is difficult or impossible and very expensive; therefore, continuous maintenance is critical to keep invasive plants at low levels to sustain attributes like navigation, flood control and recreation while conserving native plant habitat for fish and wildlife. A detailed description of the uses of Florida waters, how aquatic plants may impair these uses, aquatic plant control options, management plan development, and research and outreach

efforts is presented in the following website designed and maintained in a collaborative effort between FWC and the University of Florida, Center for Aquatic and Invasive Plants:  
<http://plants.ifas.ufl.edu/manage/>.

A summary of plant control in sovereignty public waters and associated expenditures contracted or monitored by the FWC during Fiscal Year 2014-2015 is presented in the following pages. Management statistics are summarized in Tables 1-4 and presented graphically in Figures 1-4. FWC's highest management priorities (established in rule under section 68F-54.005 F.A.C.) are the control of floating plants (water hyacinth and water lettuce) and hydrilla. "Other plants" listed in the tables include both native and nonindigenous plants that may impair the uses of Florida public waters.

Table 1 presents the amount of control and associated funding for each plant type within the boundaries of the five water management districts to provide some geographical perspective on where plants are controlled in Florida. Table 2 breaks down aquatic plant management expenditures by federal and state funds. Twelve aquatic plant species found in Florida are considered to be invasive in that they are capable of causing environmental or economic harm if not managed on a routine basis. Some are widespread like floating plants or hydrilla and are under continuous maintenance. Others are present in only a few locations and are under eradication programs to prevent them from becoming established in Florida waters. Table 3 lists individual plant types found in Florida public waters summarizing acres controlled and associated control expenditures for Fiscal Year 2014-2015. Table 4 lists management expenditures by waterbody, including assessment and monitoring costs.

Figure 1 shows the ranges in size of the floating plant populations reported in Florida public lakes and rivers in 2015. Although these plants are widespread, found in 271 public waters, most populations are being suppressed to fewer than ten acres, keeping overall management costs and environmental impacts at low levels. Figure 2 shows water hyacinth cover in Florida public waters in ten-year intervals dating from 1947 through 2015 to give an historical perspective of the presence of this prolific plant species through the decades. The Maintenance Control management philosophy was implemented for floating plants in the early 1970s - control invasive plants on a statewide coordinated, routine and consistent basis - to reduce the overall population from about 125,000 acres in 1959 to a few thousand acres at any one time for the past 35 years. Floating plants were under maintenance control in all of Florida's public waters during 2015.

Figure 3 shows acreage ranges for the 181 hydrilla populations that were reported in public lakes and rivers in 2015. Seventy-four percent of all hydrilla populations observed in 2015 covered fewer than ten acres, and hydrilla target goals were met on all Florida's public waters in 2015. Figure 4 compares funding for hydrilla control vs. acres of hydrilla reported in public waters from 1982-2015. When funding is adequate, hydrilla can be suppressed at low levels. When funding is insufficient, hydrilla expands and forms underground tubers that can persist for many years, representing the potential for immediate regrowth after control, and the need for prolonged higher levels of management funding until these tuber "banks" are depleted. The estimated tuber bank has continued to be reduced from historically higher levels.

Most of the aquatic plant control achieved by the FWC is through the use of herbicides registered for use in water by the U.S. Environmental Protection Agency and the Florida Department of Agriculture and Consumer Services. The FWC authorizes herbicide use for aquatic plant control under coverage of Generic Permit #FLG510039-IWPG issued by the Florida Department of

Environmental Protection pursuant to National Pollutant Discharge Elimination System (NPDES) regulations. The Generic Permit requires entities responsible for applying herbicides to waters of the U.S. to take measures to reduce herbicide use. The FWC meets this obligation by integrating non-chemical technologies where possible under maintenance control programs to keep invasive and nuisance plants under control in Florida public waters. All of Florida's public waters have met target goals or are in maintenance control in regards to invasive hydrilla and floating aquatic plants. The FWC continues to meet management objectives for these species while reducing overall control expenditures and herbicide use. When the highest priority species are under maintenance control, additional funding can be directed toward managing emergent and upland invasive plant species to further conserve or enhance fish and wildlife habitats.

## Year in Review - Fiscal Year 2014-2015

- **Invasive non-native plants** were reported in 97% of Florida's 457 surveyed public lakes and rivers that comprise 1.26 million acres of fresh water.
- Eradicating established invasive aquatic plant populations has proven nearly impossible; therefore, routine maintenance is needed to suppress invasive plants at low levels to sustain attributes like navigation, flood control, and recreation while conserving native plant habitat.
- **Floating water hyacinth and water lettuce**, two of the world's fastest growing plants, covered as much as 125,000 acres of Florida public waters as recently as 1959 and therefore are the FWC's highest management priorities.
- Floating plants were present in 271 public lakes and rivers in 2015 covering about 4071 acres and are under maintenance control in all of Florida's public waters. Eighty-nine percent of the floating plant populations reported in 2015 covered 10 acres or less. (Figure 1)
- Managers spent about \$5.6 million controlling 45,967 acres of floating invasive plants in Florida public lakes and rivers during FY 14-15 (Tables 1-3).
- **Submersed hydrilla**, imported during the 1950s as an aquarium plant, is capable of growing several inches per day filling the water column and covering the surface of water bodies that are not frequently and routinely managed.
- Insufficient funding allowed hydrilla to evolve into statewide water and habitat management crises by the middle 1990s infesting about 100,000 acres in 365 (80%) of Florida's public lakes and rivers. Sufficient, recurring funding and improved technology aided by FWC-funded research enabled managers to reduce hydrilla to about 30,268 acres in 2015. (Figure 4)
- Hydrilla was reported in 181 public waters in 2015 and was managed to target goals in all of Florida's public lakes and rivers; however, tubers infest about 57,600 acres and represent the potential for immediate regrowth.
- 77% of the hydrilla populations reported in 2015 covered 10 acres or less (Figure 3). Sixty-eight percent of the hydrilla reported in 2015 occurred in the four lakes of the Kissimmee Chain of Lakes, among Florida's largest and most important multiple-purpose waterways.
- Managers spent \$5.49 million applying herbicides to 9,008 acres of hydrilla in Florida public lakes and rivers during FY 14-15 to conserve the multiple uses of these resources (Tables 1-3).
- The Florida Exotic Pest Plant Council lists 12 **Category I invasive plants**, capable of disrupting aquatic ecosystems and causing harm in Florida public waters. Seven Category I plant species in addition to hydrilla, water hyacinth, and water lettuce were detected covering about 4942 acres in 90% of Florida's public waters in 2015.
- \$5.99 million were spent managing about 20,567 acres of aquatic plants other than hydrilla and floating plants during FY 14-15 (Tables 1-3). Most for the control of tussock-forming plants like burhead sedge, exotic ludwigia, frog's bit and tropical American water grass in Lakes Okeechobee, and the Kissimmee Chain of Lakes, and floating islands and tussocks in Tsala Apopka to conserve fish and wildlife habitat and navigation in the extensive marsh systems of these waters.

## Fiscal Year 2014-2015 Management Statistics

**Table 1: Acres of Aquatic Plants Treated and Treatment Expenditures in Florida Public Waters during Fiscal Year 2014 - 2015.**

Acres	Northwest	Suwannee	St. Johns	Southwest	S. Florida	TOTAL
Floating	243.75	271.00	17,919.64	5,736.88	21,796.59	45,967.86

W. Indian marsh grass	433.90	\$75,890.81
Ludwigia grandiflora/hexapetala	2,003.60	\$748,772.60
Aquatic soda apple	8.50	\$586.35
Water spinach	2.50	\$611.74
Giant salvinia	8.78	\$4,585.13
Other plants	12,390.00	\$1,807,207.82
Floating islands	1,231.51	\$1,660,124.00
<b>TOTAL</b>	<b>75,543.60</b>	<b>\$15,716,214.64</b>

## Floating Plants

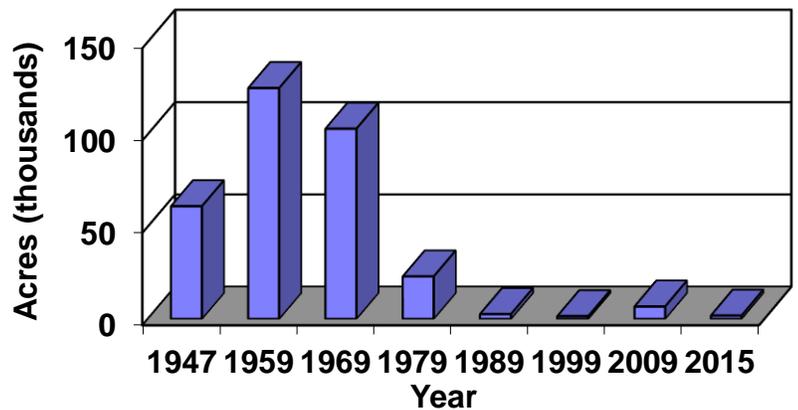

**Figure 1: Number of Public Lakes and Rivers in which Water Hyacinth Was Reported in 2015, reported by Range of Population Size.**

173 of the 240 Water Hyacinth populations reported in 2015 covered less than one acre. This is significant in that all plant populations are under maintenance control in surveyed waters. Those waters with larger floating plant levels reported in 2015 are high priorities to maintain control in 2016.

**Figure 2: Acres of Water Hyacinth Reported in Florida Public Lakes and Rivers from 1947-2013.**

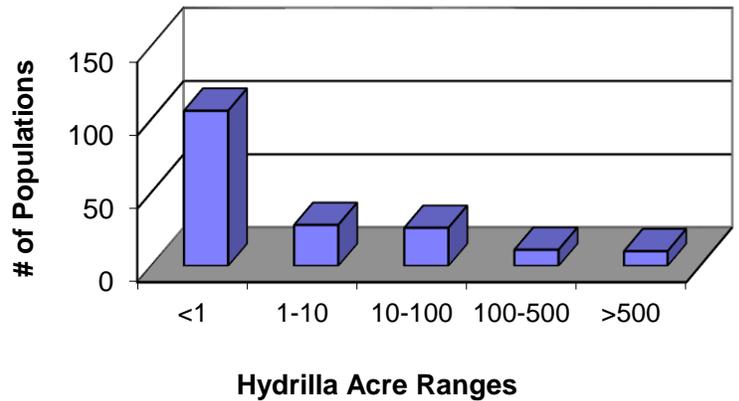

Water hyacinth reached its apex, covering more than 125,000 acres in 1959. Frequent and consistent management efforts coordinated on a statewide basis have allowed managers to reduce the standing crops of water hyacinth and water lettuce to low levels where they do not impair the multiple uses of Florida waters.

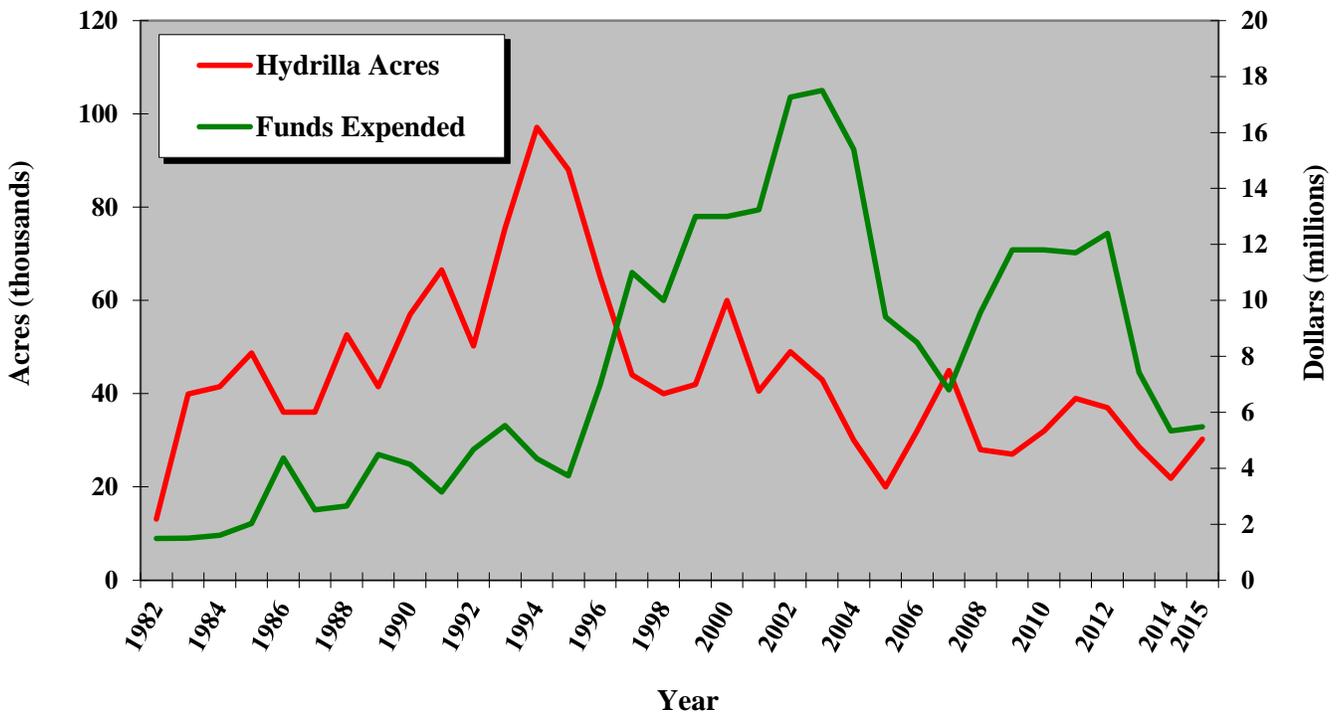

## Hydrilla

**Figure 3: Number of Public Lakes and Rivers in which Hydrilla Was Reported in 2015; Reported by Range of Population Size.**

139 of the 181 hydrilla populations reported in 2015 covered 10 acres or less, signifying that most are under maintenance control or have met target goals and are at very low levels. Populations exceeding 100 acres are the higher management priorities for 2016.

**Figure 4: Acres Reported and Dollars Spent Managing Hydrilla in Florida Public Lakes and Rivers from 1982-2015.**

When funds are sufficient, hydrilla can be managed at a low level. When funds decline, hydrilla expands to a higher level requiring additional recurring funding for control. Hydrilla reached its apex in Florida public waters in 1994, covering nearly 100,000 acres. Although the standing crop in the collective 181 waters in which hydrilla was reported in 2015 totaled about 30,268 acres, underground tubers, that represent hydrilla’s ability to immediately sprout and refill the water column, are estimated at about 57,600 acres.

**Table 4. Plants Controlled and Management Expenditures by Waterbody in Florida Public Waters during Fiscal Year 2014-2015**

**Table 4 Key**

Waterbody	Name of public waterbody
Waterbody Acres	Surface acres of public waterbody
Contractor	Agency or company that conducts aquatic plant management
AA	Applied Aquatic Management, Inc.
AVC	Aquatic Vegetation Control, Inc.
Brevard	Brevard County
CAS	Coastal Air Services
Citrus	Citrus County
FL Env.	Florida Environmental Consultants, Inc.
Highlands	Highlands County
Hillsborough	Hillsborough County
Lake	Lake County
Orange	Orange County
Palm Beach	Palm Beach County
Polk	Polk County
SFWMD	South Florida Water Management District
SJRWMD	St. Johns River Water Management District
SWFWMD	Southwest Florida Water Management District
USACE	U.S. Army Corps of Engineers
Winter Park	City of Winter Park
County	County in which the water body lies (Note: many water bodies lie in more than one county, for example: the St. Johns River lies in 11 counties, but for reporting purposes has been assigned to St. Johns County)
WMD	Water Management District in which the water body lies
Plant Type	Name of plant (note: floating plants = water hyacinth and/or water lettuce)
FY 14-15 Acres Treated	Acres of plants managed during fiscal year 2014-2015
FY 14-15 Dollars Spent	Dollars spent managing plants, including assessment and monitoring, during fiscal year 2014-2015
*	Costs associated solely with survey/inspection of waters or snagging of trees where acreage is not reported.
**	Signifies that an additional treatment was required on the same acreage of vegetation to maintain lethal concentrations in the plants. The additional treatment applied to North Lake Talmadge was in support of treatment conducted last fiscal year (2013-14). Total treatment acres =115.7.
